IIIICIILCU CUUC

u inherited a piece of code that performs username validation for your company's website. The existing action works reasonably well, but it throws an exception when the username is too short. Upon review, u realize that nobody ever defined the exception.

e inherited code is provided for you in the locked section of your editor. Complete the code so that, nen an exception is thrown, it prints $\frac{1}{100}$ short: $\frac{1}{100}$ (where $\frac{1}{100}$ is the length of the given username).

put Format

e first line contains an integer, T, the number of test cases. ch of the T subsequent lines describes a test case as a single username string, U.

nstraints

- $1 \le T \le 1000$
- $1 \le |U| \le 100$
- The username consists only of uppercase and lowercase letters.

itput Format

u are not responsible for directly printing anything to stdout. If your code is correct, the locked stub covour editor will print either $\begin{array}{c} \text{Valid} \\ \text{O} \end{array}$ (if the username is valid), $\begin{array}{c} \text{Invalid} \\ \text{Invalid} \end{array}$ (if the username is invalid), or $\begin{array}{c} \text{O} \\ \text{O} \end{array}$ (where N is the length of the too-short username) on a new line for each test case.

mple Input

3 Peter Me Arxwwz

mple Output

Valid Too short: 2 Invalid

planation

ername $\frac{Me}{N}$ is too short because it only contains 2 characters, so your exception prints \mathbf{Too} \mathbf{short} : 2 other validation is handled by the locked code in your editor.
